Peripheral Arterial Disease: Screening, Evaluation and Management

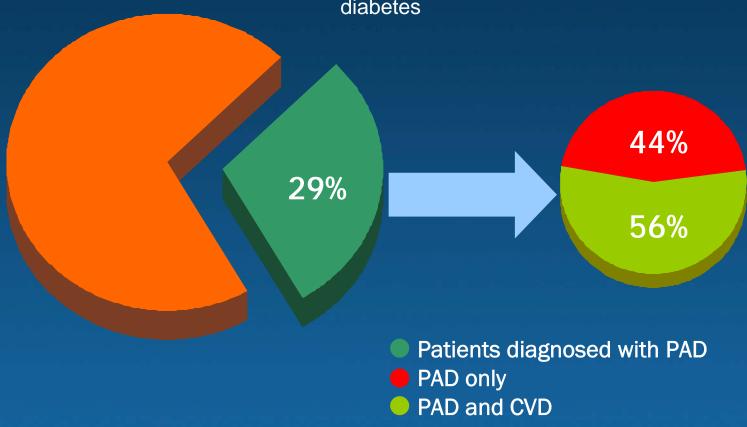

Mitchel Sklar, MD, FACC, FSCAl Cardiovascular Associates of R.I.

Natural History of Intermittent Claudication/PAD: Peripheral to what?

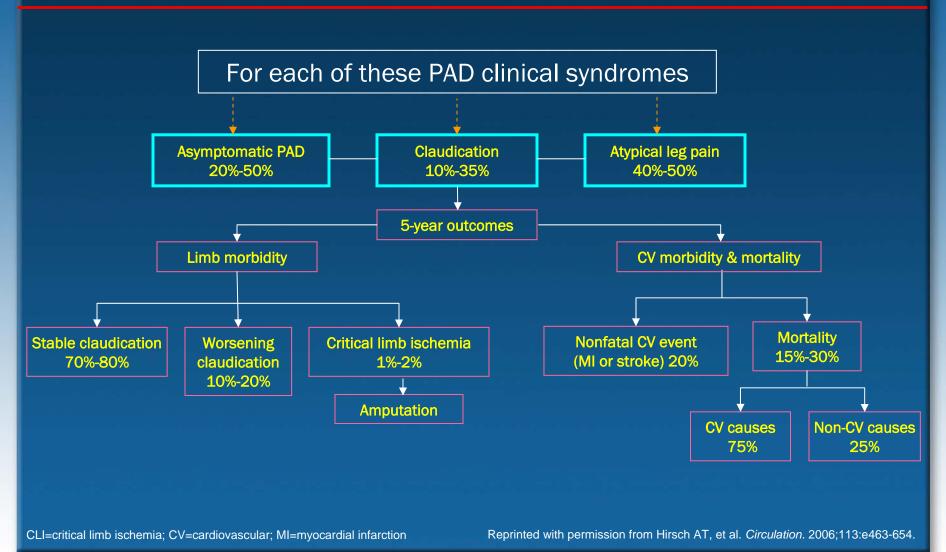

PARTNERS Trial: PAD and CAD there if you look for it

29% of Patients in a Target Population Were Diagnosed With PAD Using An Office-Based ABI done <u>on all patients</u> over 70 or over 50 with smoking hx or diabetes

Natural History of Atherosclerotic Lower Extremity PAD

"At Risk" and Presentations for Lower Extremity PAD

- Age less than 50 years with diabetes, and one additional risk factor (e.g., smoking, dyslipidemia, hypertension, CRP)
- Age 50 to 69 years and history of smoking or diabetes
- Age 70 years and older
- Leg symptoms with exertion (suggestive of claudication) or ischemic rest pain
- Abnormal lower extremity pulse examination
- Known atherosclerotic coronary, carotid, or renal artery disease

- Asymptomatic
- Intermittent claudication
 Discomfort, ache, cramping in leg with exercise—resolves with rest
- Functional impairment
 Slow walking speed, gait disorder, imbalance
- Rest pain

 Pain or paresthesias in foot or toes, worsened by leg elevation and improved by dependency
- Ischemic ulceration and gangrene

Claudication vs. Pseudoclaudication

	Claudication	Pseudoclaudication	
Characteristic of discomfort	Cramping, tightness, aching, fatigue	Same as claudication plus tingling, burning, numbness	
Location of discomfort	Buttock, hip, thigh, calf, foot		
Exercise-induced	Yes	Variable	
Distance	Consistent Variable		
Occurs with standing	No	Yes	
Action for relief	Stand Sit, change position		
Time to relief	<5 minutes	≤30 minutes	

The First Tool to Establish the PAD Diagnosis: Don't let the shoe come between you and a diagnosis

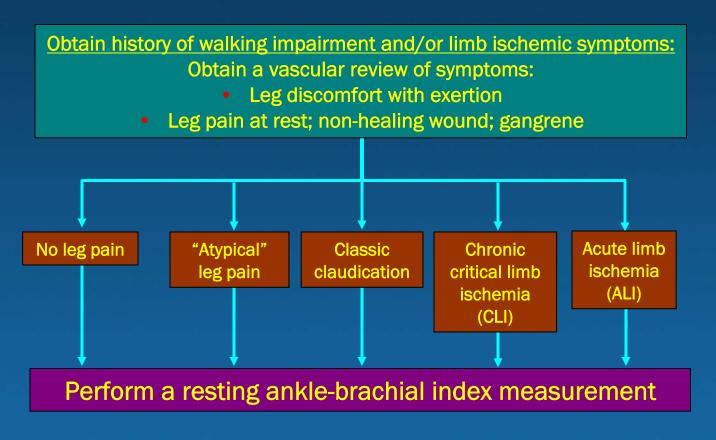

Pulse intensity should be assessed and should be recorded numerically as follows:

- 0, absent
- 1, diminished
- 2, normal
- 3, bounding
- -Bilateral UE BP's
- -Aorta, carotid and femoral for mass or bruit
- -Pedal exam for pulse, lesions or elevation pallor

ACC/AHA Guideline for the Diagnosis of PAD

Recognizing the "at risk" groups leads to recognition of the five main PAD clinical syndromes:

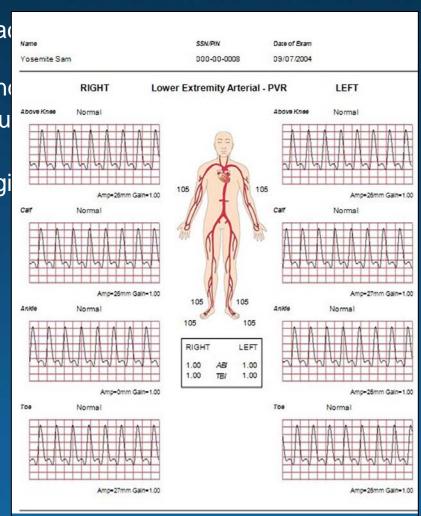

Interpreting the Ankle-Brachial Index

- Incompressible arteries (elderly patients, patients with diabetes, renal failure, etc.)
- Resting ABI may be insensitive for detecting mild aorto-iliac occlusive disease
- Not designed to define degree of functional limitation
- Normal resting values in symptomatic patients may become abnormal after exercise
- "Non-compressible" pedal arteries is a physiologic term and such arteries need not be "calcified"
- Sensitivity/specificity 95-99%

ABI	Interpretation
1.00-	Normal
1.29	
0.91- 0.99	Borderline
0.99	Mild-to-
0.41-	moderate
≤0.40	Severe
≥1.30	Noncompressible

Non-invasive Vascular Study: "If you don't take the temperature, you can't find the fever"

- Ankle-Brachial Index (ABI), Toe-Brack Recording (PVR) device
 - Measures arterial blood flow, and
- Twenty (20) minute non-invasive stu
- Training in less than one day
- Minimum requirements of technologi
 - Can take a blood pressure
 - Find a pulse
 - Log onto a computer
- Follow-up intervention/surgery
- Covered by insurance
- Generates report

Noninvasive Imaging Tests

Duplex Ultrasound

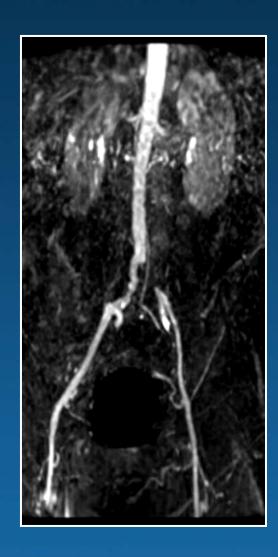

Duplex ultrasound of the extremities is useful to diagnose the anatomic location and degree of stenosis of PAD.

Duplex ultrasound is recommended for routine surveillance after femoral-popliteal or femoral-tibial-pedal bypass with a venous conduit. minimum surveillance intervals are approximately 3,6, and 12 months, and then yearly after graft placement.

Magnetic Resonance Angiography (MRA)

- MRA has virtually replaced contrast arteriography for PAD diagnosis
- No ionizing radiation and noniodine-based intravenous contrast medium
- Use to plan intervention/revascularization
- ~10% of patients cannot utilize MRA because of:
 - Claustrophobia
 - Pacemaker/implantable cardioverterdefibrillator
 - Obesity
- Gadolinium use in individuals with an eGFR <60 mL/min has been associated with nephrogenic systemic fibrosis (NSF)/nephrogenic fibrosing dermopathy

Computed Tomographic Angiography (CTA)

- Requires iodinated contrast
- Requires ionizing radiation
- Use to plan intervention/revascularization
- Shows arterial calcification

ACC/AHA Guideline for the Management of PAD: They have "the disease"

Confirmed PAD diagnosis

Risk factor normalization:

Immediate smoking cessation
Treat hypertension: JNC-7 guidelines
Treat lipids: NCEP ATP III guidelines
Treat diabetes mellitus: HbA1c less than 7%

Pharmacological risk reduction:
Antiplatelet therapy
(ACE inhibition; Class IIa)

Treatment of Claudication (?revascularize if fails 3 mo trial)

ACE=angiotensin-converting enzyme; JNC-7=Joint National Committee on Prevention; NCEP=National Cholesterol Education Program – Adult Treatment Panel III.

Hirsch AT, et al. J Am Coll Cardiol. 2006;47:e1-e192.

Medical Therapy for Claudication

- -Treatment with a statin to achieve a target LDL cholesterol of less than 100 mg/dl.
- -Anti-HTN therapy to goal <140/90 (non-DM) or <130/80 (DM); beta-blockers not contra-indicated
- -Antiplatelet therapy—ASA or Clopidogrel
- -Supervised exercise program of 30-45 min. over 3xweek for 12 weeks
- -Stop smoking
- -Cilostazol 100mg bid (in absence of heart failure)

-NOT INDICATED: pentoxyphylline (IIb), L-arginine, ginko biloba, oral prostaglandins, Vit E, chelation

Indications for Revascularization in the Patient With Intermittent Claudication

- A lack of adequate response to exercise therapy and drugs
- Presence of a serious impairment of activities important to the patient—work, ADL's, cardiac rehab.
- Absence of concurrent disease that limits exercise (e.g., angina or chronic respiratory disease).
- The individual's anticipated natural history and prognosis.
- Appropriate lesion morphology

Renovascular Hypertension: Clinical clues

- Female with severe HTN and no FHx (FMD?)
- Uncontrolled HTN on 3 Rx (including diuretic)
- Worsening HTN control in compliant pt
- ARF or elevated Cr with new ARB or ACEI
- CRI with mild proteinuria and bland sediment
- Recurrent flash pulmonary edema
- > 1.5 cm difference in renal size
- Epigastric bruit
- HTN + PAD

Noninvasive evaluation of RAS

- Duplex Ultrasound
- CTA or MRA
- Less useful:
 - Captopril renal scan
 - Renal Vein renin sampling
 - Plasma Renin
 - Captopril Test

AAA screening and testing

Asymptomatic:

- Class I
 - Men 60 years of age or older with FHx of AAA
- Class IIa
 - Men who are over 65 years of age who have ever smoked need directed PE and duplex once

Symptomatic

- Class I
 - In patients with the clinical triad of abdominal and/or back pain, pulsatile mass or hypotension need immediate surgical evaluation
 - In patients with symptomatic aortic aneurysms, repair is indicated regardless of diameter

The PAD Guideline is Intended to Guide Lifelong Primary to Specialty PAD Care

Population at risk:
(Age and risk factors)
Establish the PAD diagnosis

<u>Population with symptoms</u>: Improve limb outcomes Prevent CV ischemic events Population remains at risk:

Primary care

management of
legs and life, in
collaboration with

vascular specialists

- ABI/TBI
- PVR
- Duplex US
- MRA
- CTA
- Angiography

Medical Therapy Endovascular Therapy Surgical Therapy

Integrated care requires a partnership of vascular specialists (vascular medicine, cardiology, interventional radiology, surgery, podiatry, and others)

www.padcoalition.org

A public, interdisciplinary, not-for-profit Coalition devoted to creating a national PAD public awareness campaign and to coordinating PAD public and physician education.

Supplemental slides

Rose Questionnaire for PAD

•	Pain with walking	Y	Sens	99% Spec	13%
•	Pain standing or sitting	Ν		99%	80%
•	Walking uphill or hurry	Y		98	13
•	Ordinary pace on level	ground			-
•	Relief standing still	Υ		91	64
•	Where is the pain calf > thigh/buttock				

Overall 91% specific and 99% sensitive for diagnosing intermittent claudication in symptomatic patients

Differential Diagnosis of PAD

- Intermittent Claudication
 - Atherosclerosis
 - Non-Atherosclerotic
 - TAO/Buerger's
 - Popliteal Art. Entrapment Syndrome
 - Adventitial Cystic Dis. of the Popliteal Artery
 - FMD
 - Vasculitis
 - Trauma/Radiation

- Musculoskeletal Causes
 - Arthritis
 - Bursitis
 - Tendonitis
 - •Athlete's Comp. Syn.
 - Bakers Cyst
- Venous Claudication
- Neurogenic Causes
 - Lumbar Canal Stenosis
 - Peripheral Neuropathy
- Podiatric Causes
 - Plantar Fasciitis

Noninvasive Imaging Tests

Magnetic Resonance Angiography (MRA)

MRA of the extremities is useful to diagnose anatomic location and degree of stenosis of PAD.

MRA of the extremities should be performed with a gadolinium enhancement.

MRA of the extremities is useful in selecting patients with lower extremity PAD as candidates for endovascular intervention.

Noninvasive Imaging Tests

Computed Tomographic Angiography (CTA)

CTA of the extremities may be considered to diagnose anatomic location and presence of significant stenosis in patients with lower extremity PAD.

CTA of the extremities may be considered as a substitute for MRA for those patients with contraindications to MRA.

Medications for Patients With PAD

Therapeutic Goal

Drug	To Reduce Ischemic Events	To Improve Claudication Symptoms	
Clopidogrel (Plavix®)	Yes	No	
Cilostazol (Pletal®)	No	Yes	

Endovascular Treatment for Claudication

Endovascular procedures are indicated for individuals with a vocational or lifestyle-limiting disability due to intermittent claudication when clinical features suggest a reasonable likelihood of symptomatic improvement with endovascular intervention and...

- a. Response to exercise or pharmacologic therapy is inadequate, *and/or*
- b. there is a very favorable risk-benefit ratio (e.g. focal aortoiliac occlusive disease)

Endovascular Treatment for Claudication

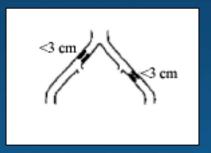

I lla llb lll

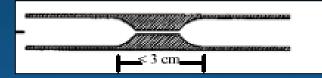

Endovascular intervention is recommended as the preferred revascularization technique for TASC type A iliac and femoropopliteal lesions.

Iliac

TASC A: (PTA recommended)

Femoropopliteal

TASC B: (insufficient data to recommend)
